

Cross-trial comparability (transitivity) dashboard — WPRT vs PORT in localized prostate cancer

GETUG-01 RTOG 9413 POP-RT RTOG 0924 PEACE-2

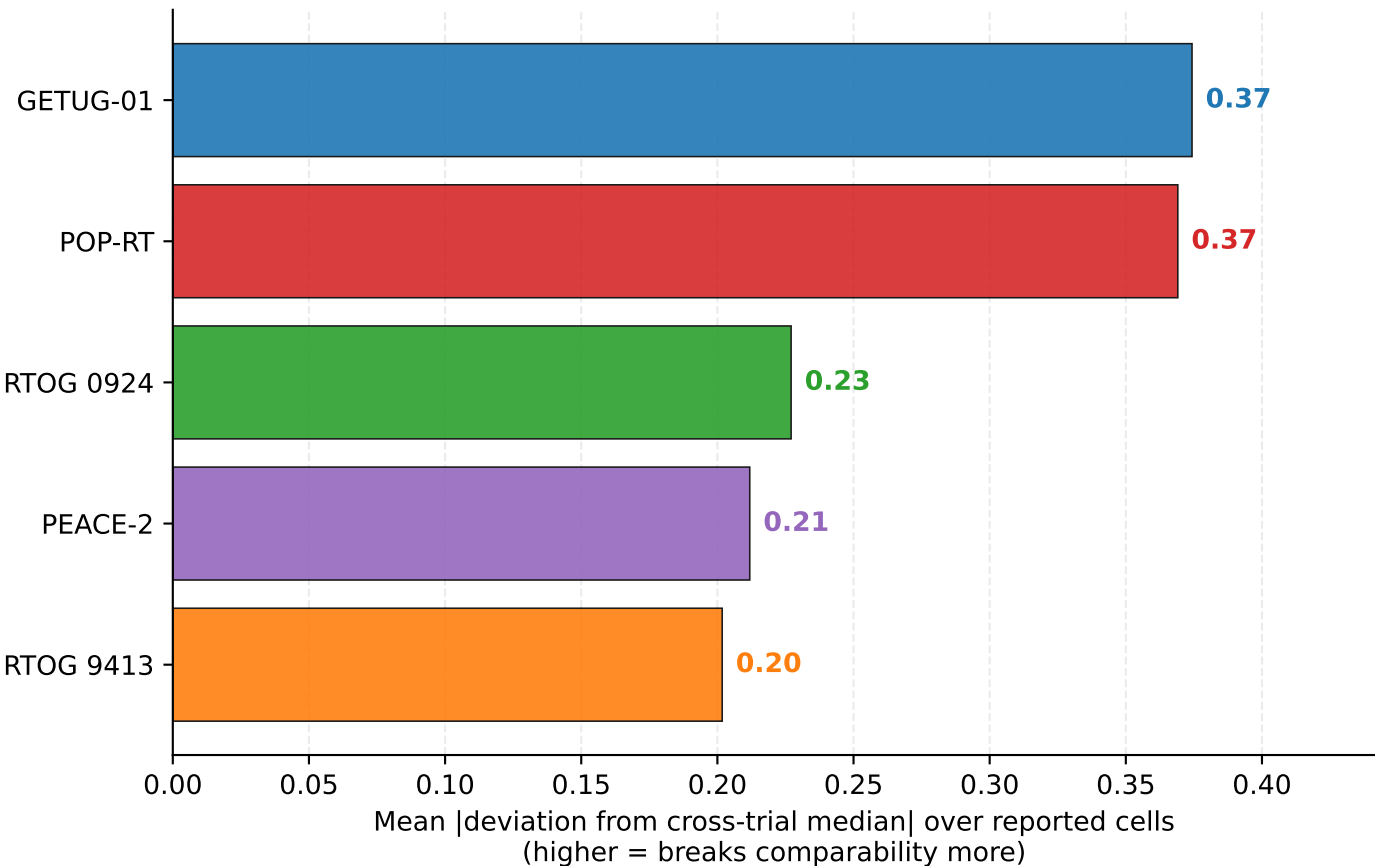

a Effect-modifier comparability across trials (per-row normalized over reported cells; darker = higher; grey = n.r.)

b Key modifiers, normalized per axis (complete-data axes only)

c Trial atypicality score

POP-RT is the consistent outlier (single-centre, PSMA staging, highest pelvic EQD2, common-iliac coverage, 24-mo ADT). Effect-modifier axes are collinear → trial-level meta-regression is exploratory only.
* estimate for visualization; † not located in primary source (SEOR deck cited 24.5%); ‡ observed median (others prescribed); n.r. = not reported / not derivable.
PEACE-2 Gleason reported only as 8-10 (75-79%); RTOG 0924 median PSA not derivable from slides; PSMA staging counts PSMA-PET only (PEACE-2 ~18% imaging was mostly choline).
